

# Adding a whitelist to your server

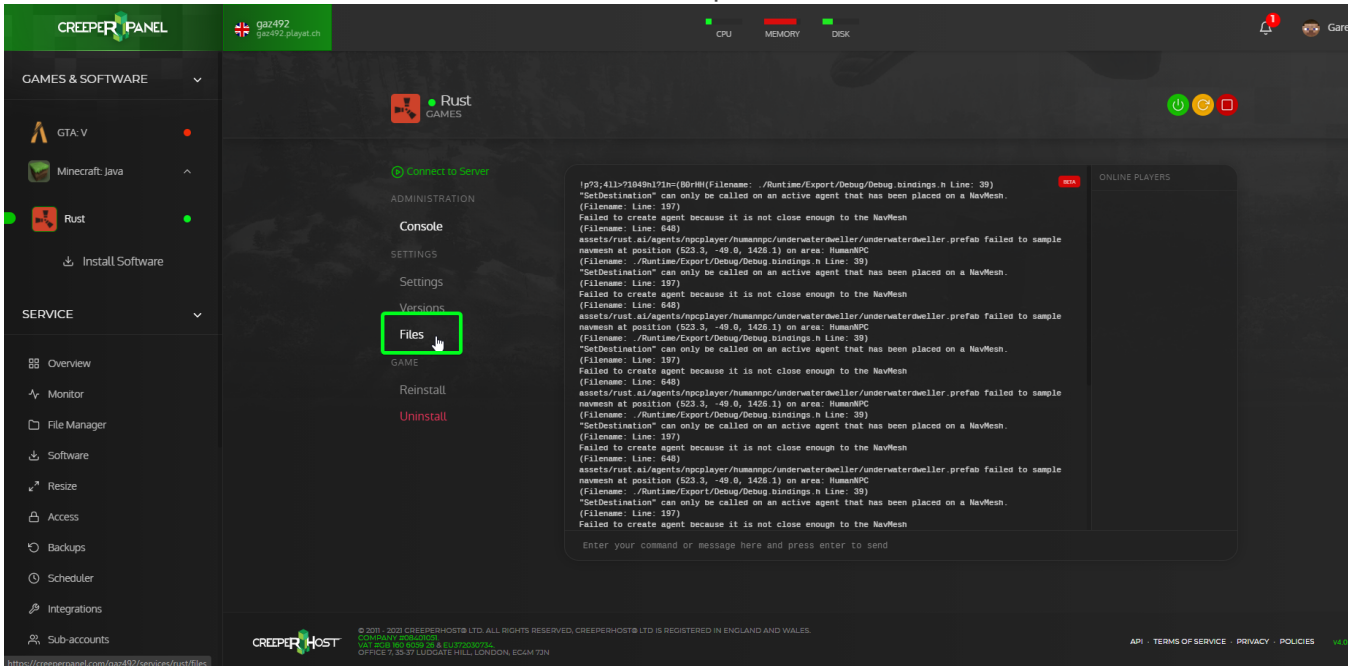

To add a whitelist to your server you will first need to install Oxide/UMod on your service  
We have a guide to install Oxide/UMod at

<https://www.creeperhost.net/wiki/books/rust/page/installing-oxideumod>

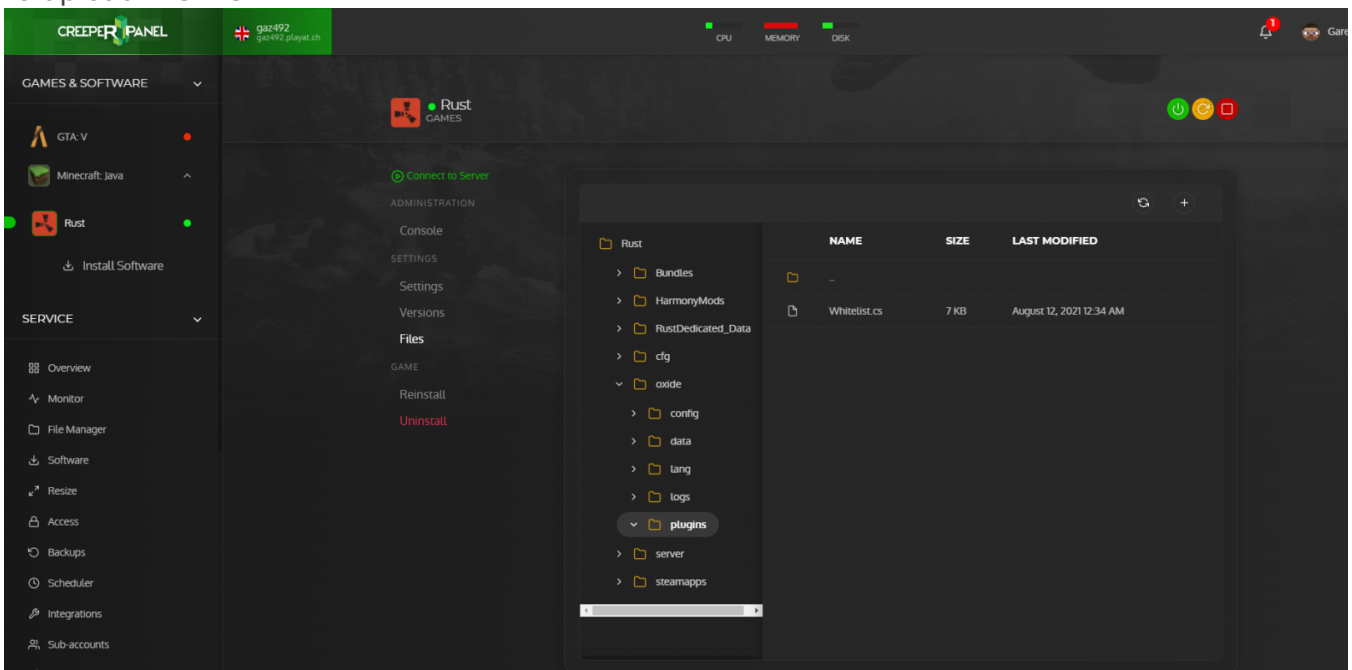

1. Download the whitelist plugin by Wulf at <https://umod.org/plugins/whitelist>

The screenshot displays the UMod website interface for the 'Whitelist' plugin by Wulf. The top navigation bar includes 'Umod', 'Marketplace', 'Plugins', 'Games', 'Docs', 'Community', and a 'Sign In' link. The plugin page features a 'Whitelist' header with a 'Wulf' profile icon. Below the header, a description states 'Restricts server access to whitelisted players with permission'. A 'Supported Games' section shows 'L'. The version 'v3.3.0' is listed, along with a '3 years ago' timestamp. Documentation tabs for 'Permissions', 'Configuration', and 'License' are visible. The 'Permissions' section explains that the plugin uses a permission system and lists the 'whitelist.allow' permission. The 'Configuration' section mentions that settings can be configured in the 'whitelist' file under the 'config' directory. On the right sidebar, a 'Download' button is highlighted with a green box, alongside 'Donate' and 'Help' buttons. Below these, statistics show '42.0K downloads' and '238 watchers'. Further down, a 'More by Wulf' section lists other plugins: 'No Give Notices', 'Countries', and 'Logger'. A footer at the bottom contains a cookie notice.

- Click on Rust in the sidebar then click on Files to open the file browser for rust

- Navigate to the `oxide > plugins` folder by double-clicking on the folders.
- Drag and drop the `Whitelist.cs` file you downloaded from the link above to the file browser to upload the file

- Start your server, once it's started the plugin should be loaded.
- Connect to your server and once in-game press F1 and enter the following command `oxide.grant user steamid whitelist.allow` replacing `steamid` with the SteamID of the player you wish to whitelist then press enter. You can find the SteamId of the player by going to a website such as <https://steamid.io/>
